US military standard MIL-STD-662F V50 Ballistic Test define a commonly used procedure for this measurement. The goal is to get three shots that penetrate that are

slower than a second faster group of three shots that are stopped by the armor. These three high stops and three low penetrations can then be used to calculate a v 50 velocity. Time-based measurement systems tend to be well aligned for measuring non-uniform behaviors such as duration or latency recording, interval recording, or time sampling. Interval recording and momentary

time sampling are flexible and provide useful data. Across these systems an observation period is divided into equal intervals and observations are recorded for each interval. Behavior Dimensions and Measurement

Systems Measurement is accurate when the observed values of an event match the true values of an event. Measurement is reliable when it yields the same values across repeated measurement of the same event. So, in other words, ABA is an objective discipline and focuses on the reliable measurement and objective evaluation of observable behavior.
